BACKGROUND OF THE INVENTION

The present invention relates to an auction method using a communication network. In particular, the present invention relates to an automatic auction method  
5 whereby purchasing persons located in remote places participate in a transaction by sending auction ordering information to an auctioneer via an open communication network represented by the Internet and an auction is automatically conducted on the basis of the auction  
10 ordering information.

Wholesale marketplaces serve as places for making distribution of fresh foods and the like smooth and making transactions of them proper. In particular, prices formed in wholesale marketplaces exert great  
15 influences on the growing areas and consumption. In the wholesale marketplace system, therefore, prices need to be formed by quick and fair valuation based upon the supply-demand relations of the fresh foods. Accordingly, purchase and sale transactions in wholesale marketplaces  
20 are conducted by the "auction or sealed bid" in principle.

As against such a principle, transaction forms such as the "receipt in advance" (the wholesale before the sale start time) have become the mainstream instead  
25 of the marketplace transactions as a result of the

increase in scale of growing areas, the increase in distance from growing areas, the increase in scale of retail departments, and the progress of intensiveness of the retail departments. In addition, electronized  
5 products are also becoming subjects of transactions.

In order to destroy such a status quo, "information transactions" using advance shipping information given from shipping persons by making information concerning transactions electronic are now  
10 under study in various places. As one form realizing this information transaction, a system is shown in JP-B-7-117976. In this system, shipping information given from shipping persons is provided to wholesalers and bidders, the wholesalers and the bidders conduct a  
15 bid on the basis of the shipping information, and a wholesaler or a bidder of the highest price makes a successful bid. As a method for mechanically conducting transaction processing which relates to the information transactions, there is a mechanical auction ("Is there a  
20 future in wholesale marketplaces," edited by Shigeo Akitani/ Food distribution study society and published by Japan economic newspaper company in 1996, pp. 140-143). In the mechanical auction, all purchasing persons gather around a marketplace, and presents desired prices from  
25 respective terminal devices. Besides this, the mechanical auction described in this paper provides the following function. Even if a certain person is not present in the marketplace, the person can effect a

sealed bid at the time of the auction so long as the person inputted beforehand desired quantities and desired prices for a desired list of articles.

In the former cited JP-B-7-117976, mechanization of a sealed bid is described. In the mechanical auction of the latter cited paper, auction mechanization is described. In an actual auction, however, a purchasing person does not always conduct a successful bid at a preset desired price. Even in the case where the latter cited auction mechanization is employed, price presentation needs to be conducted between the bidder and the auctioneer according to the situation of the auction several times until the end of the auction. While the auction is being conducted, a person restrained before an auction terminal device needs to form a judgment and give instructions according to the situation of the auction.

Furthermore, in the case of an auction, bidders must cope with the present situations extemporaneously. Therefore, the bidders must participate on-line and in real time.

#### SUMMARY OF THE INVENTION

An object of the present invention is to provide an automatic auction method which makes it unnecessary for the bidders to be <sup>con</sup>strained before terminal devices at the time of execution of an auction even if the situation of the auction changes every moment.

Another object of the present invention is to provide an automatic auction method which makes possible auction transactions on open networks such as the Internet.

- 5 Another object of the present invention is to provide an automatic auction method whereby auction prices can be automatically determined.

In order to achieve the above described objects, an auction is executed by the following procedure in a system in which bidder terminals are connected to an auctioneer terminal via on-line circuits.

On bidder terminals, information about <sup>an</sup> auction received from the auctioneer terminal via on-line circuits is displayed. This information about <sup>the</sup> auction may be procured spontaneously by the bidders via the Internet or personal computer communication, or may be forcibly sent to bidders by the auctioneer via electronic mail.

On bidder terminals, information about <sup>the</sup> auction is displayed. An auction subject is selected by each bidder (terminal operator). For the selected auction subject, the number of purchase, a desired price, and <sup>the</sup> highest possible price in competition for the desired price (a variation value indicating an addition allowed for the desired price) are specified on the screen by the bidder. Auction ordering information containing these information pieces is created, and transmitted to the auctioneer terminal.

B  
1 The display and information inputting on the bidder terminal can be implemented by using, for example, <sup>a</sup> the browser broadly known in the Internet. A plurality of inputted information pieces may also be sent to a  
5 server by using the function of the known browser.

B  
B  
B  
10 For each ~~of~~ selected auction subject<sup>d</sup>, a flag specifying whether participation in the auction should be conducted after effecting a successful bid once, or a flag specifying whether <sup>a</sup> purchase should be conducted even  
10 if the number of purchase is less than a desired amount, <sup>^</sup> can be added to the auction ordering information. The number of purchase can be specified by any ~~one~~ method selected out of constant quantity designation, quantity range designation, and remaining quantity designation.

15 The auctioneer terminal collects and stores a plurality of auction ordering information pieces received via on-line circuits such as the Internet. These auction ordering information pieces have been sent from a plurality of bidders. At the auction start time, for example,  
20 such as 10 a.m. everyday, an auction is started. At the auction, a price is first set. As for this price, an initial value for starting the auction may be inputted. Subsequently, the stored auction ordering information pieces are searched for a desired price coinciding with  
25 the set price. If there are auction issues, those transactions are settled. Otherwise, a price is reset.

As for the price resetting, the price is lowered in the case where there are no auction issues

b (i.e., in the case of <sup>a</sup>noncompetitive state). In the case  
^ where the amount of the auction subject does not satisfy  
auction issues (in the case where (the amount which can  
be auctioned) < (auction issues), i.e., in the case of  
5 the competitive state), the auction price is raised. It  
is determined by effecting a comparison with the desired  
price whether there is a coinciding auction issue. In  
the case of the competitive state, however, it is deter-  
mined by comparing (the set auction price) with ((the  
10 desired price) + <sup>the</sup> (highest possible price in competition))  
^ whether there is an auction issue satisfying the  
condition.

Until all auction issues are sold or a fixed  
price is reached, such processing is repeated.

b  
15 The processing to be executed on the bidder  
terminals and the auctioneer terminal can be implemented  
by using computer programs. These programs can be stored  
on a storage medium such as a floppy disk, an optical  
disk, or a hard disk, and can be distributed via a  
20 network.

#### BRIEF DESCRIPTION OF THE DRAWING

FIG. 1 is an entire processing flow diagram of  
an automatic auction method in an embodiment of the  
present invention;

25 FIG. 2 is a system configuration diagram  
showing an embodiment of the present invention;

FIG. 3 is a product information providing

screen in an embodiment of the present invention;

FIG. 4 is an auction condition input editor in an embodiment of the present invention;

FIG. 5 is an auction rule editor in an  
5 embodiment of the present invention;

FIG. 6 is an auction ordering situation screen in an embodiment of the present invention;

FIG. 7 is an auction result screen in an embodiment of the present invention;

10 FIG. 8 is an electronic marketplace monitor in an embodiment of the present invention;

FIG. 9 is a selection screen of products monitored by the electronic marketplace monitor in an embodiment of the present invention;

15 FIG. 10 shows the electronic marketplace monitor in the case where there is a new registrator in an embodiment of the present invention;

FIG. 11 shows an auction monitor in competition in an embodiment of the present invention;

20 FIG. 12 shows the auction monitor at the time  
*Competition vanishes*  
1 ~~of vanishment of competition~~ in an embodiment of the present invention;

FIG. 13 shows the auction monitor at the time of a successful bid in an embodiment of the present  
25 invention;

FIG. 14 is a processing flow diagram of a purchase desiring purchasing person search routine showing an embodiment of the present invention;

FIG. 15 is a processing flow diagram of a competition judging routine showing an embodiment of the present invention;

FIG. 16 is a processing flow diagram of a competition vanishing routine showing an embodiment of the present invention;

FIG. 17 is a processing flow diagram of a product allocation routine showing an embodiment of the present invention;

FIG. 18 is a processing flow diagram of a product allocation routine showing an embodiment of the present invention and is a continuation of FIG. 17;

FIG. 19 shows auction conditions showing an embodiment of the present invention; and

FIG. 20 shows registered purchasing persons and auction ordering information showing an embodiment of the present invention.

#### DESCRIPTION OF THE PREFERRED EMBODIMENTS

Hereafter, embodiments of the present invention will be described in detail by referring to <sup>the</sup> drawing.

FIGS. 1 and 14 through 18 show processing flows of the present embodiment. FIG. 2 is an entire configuration diagram of a system of the present embodiment. FIGS. 3 through 13 show screen images of the present embodiment.

First of all, the entire configuration diagram of an automatic auction system shown in FIG. 2 will now

The output device 113 is a device for visibly displaying registered product information on a screen or a paper medium. As the output device 113, a CRT display, a liquid crystal display, a printer device or the like, 5 for example, can be used.

The storage device 114 is a device for storing a program executed by the computer 111 and a large quantity of data files. As the storage device 114, a magnetic disk, an optical disk, an optical magnetic disk, 10 a semiconductor memory, or the like can be used.

In the storage device 114 of the electronic marketplace server 11, information concerning shipping products, such as varieties, ranks, amounts, prices, and producers, provided by the shipping person client 13 is 15 stored beforehand.

The communication cable 115 is, for example, a telephone circuit for transmitting the information. As the communication cable 115, a cable capable of transmitting a large quantity of data at high speed, such as an 20 optical cable, is desirable. If in this case data are sent/ received between the electronic marketplace server 11 and the communication network 14 by using a wireless communication circuit, a wireless communication circuit interface is provided instead of the communication cable 25 115.

In order to provide the product information stored in the storage device simultaneously to a large number of other systems and accept the auction ordering

information, it is desirable to use a computer of high speed and large capacity, a work station, or a personal computer as the electronic marketplace server 11.

(2) Device configuration of purchasing person  
5 client 12

b  
b  
In the purchasing person client 12, an input device 122, an output device 123, a storage device 124, and <sup>a</sup>the communication cable 125 are connected to a computer 121. <sup>These</sup> Structures of <sup>these elements</sup> ~~them~~ are fundamentally the  
10 same as those of the input device 112, the output device 113, the storage device 114, and the communication cable 115, and consequently <sup>their</sup> ~~the~~ descriptions of them will be omitted.

(3) Device configuration of shipping person  
15 client 13

B  
B  
In the shipping person client 13, an input device 132, an output device 133, a storage device 134, and <sup>a</sup>the communication cable 135 are connected to a computer 131. <sup>These</sup> Structures of <sup>these elements</sup> ~~them~~ are fundamentally the  
20 same as those of the input device 112, the output device 113, the storage device 114, and the communication cable 115, and consequently <sup>their</sup> ~~the~~ descriptions of them will be omitted.

(4) Device configuration of communication  
25 network 14

B  
The device configuration of the communication network 14 can be formed by a high-speed communication network, for example, such as a B-ISDN or an ATM-LAN. To

be concrete, the communication network 14 is an open network represented by the Internet, or a network using a private circuit of personal computer communication or the like.

5           The purchasing person client 12 is a bidder terminal. The electronic marketplace server 11 is an auctioneer terminal.

The summary of the processing flow of the present embodiment will be hereafter described.

10           First of all, the shipping person client 13 registers information of products to be shipped into the electronic market server 11.

          The electronic marketplace server 11 notifies the purchasing person client 12 of the registered product  
15 information by using, for example, the WWW (World Wide Web) or the like. <sup>At a</sup> ~~Until~~ predetermined time, the elec-  
tronic marketplace server 11 accepts auction ordering information from the purchasing person client 12.

          By using a method which will be described  
20 later, the purchasing person client 12 procures product information from the electronic marketplace server 11. In the case where products desired to be bought have been found, the purchasing person client 12 creates auction ordering information by using a method which will be  
25 described later, and registers it in the electronic marketplace server 11. If the predetermined time limit for auction ordering information has not been reached, the purchasing person client 12 can amend or delete the

registered auction ordering information by using a method which will be described later.

5 The electronic marketplace server 11 manages and monitors the auction ordering information. When the time limit for auction ordering information has been reached, the electronic marketplace server 11 terminates the acceptance of auction ordering information, and conducts an auction on the basis of the accepted auction ordering information by using a method which will be described later. Then the electronic marketplace server 11 notifies the purchasing person client 12 of an auction result by using, for example, the WWW (World Wide Web), an electronic mail, or the like.

15 By using a method which will be described later, the purchasing person client 12 procures the result of the auction from the electronic marketplace server 11.

Hereafter, respective methods will be further described by referring to the drawing.

20 By using a browser of the WWW installed in the computer 121, the purchasing person client 12 accesses the electronic marketplace server 11, and procures the product information. A screen displayed to the browser is a product information screen 21 shown in FIG. 3. On the screen, a product number 211 and attribute information of the product are displayed as the product information. The product attribute information includes a variety 212, standard and color 213, a growing area

B 214, a shipping person 215, an amount 216, <sup>and</sup> a product  
image 219 such as a color photograph of the product. As  
information concerning the auction, the time limit for  
auction ordering information 217 and scheduled auction  
5 end time 218 may also be included in the product informa-  
tion. In the case where a purchasing person serving as a  
bidder wants to purchase a displayed product, the pur-  
chasing person presses an ordering button 221 associated  
with the product with the mouse.

10 If the ordering button 221 on the product  
information screen 21 shown in FIG. 3 is pressed, an  
auction condition input editor 31 shown in FIG. 4  
appears. In the auction condition input editor 31, a  
purchasing person ID 311 representing a bidder and an  
15 ordering product number 312 are displayed. As the  
purchasing person ID, the electronic mail address and  
other specific identifiers, for example, of the  
purchasing person can be used. As for the product number  
312, the product number 211 of the product selected on  
20 the screen of FIG. 3 is automatically stored. A rule  
list 313 forms a part of the auction ordering information  
sent to the electronic marketplace server 11. The rule  
list 313 includes a desired auction price which is a  
purchase condition of the product, a purchase amount, and  
25 a maximum allowed price in competition for the desired  
price. For example, the representation "purchase 80  
boxes at ¥90 (+¥2)" in FIG. 4 indicates that the desired  
auction price is ¥90, the maximum allowed price in

FIR

competition is +¥2, and the purchase amount is 80 boxes. In other words, the purchasing person desires to buy the product at ¥90, but up to ¥92 can be paid in the case of competition with another purchasing person. A field 314  
5 is information specifying whether the purchasing person will participate in the auction after the purchasing person has conducted a successful bid once.

A new rule registration button 321, a rule correction button 322, a rule deletion button 323, a rule  
10 priority raising button 324, a rule priority lowering button 325, a button 326 for transmitting the auction ordering information to the electronic marketplace server 11, and a button 327 for suspending the auction ordering information creation are icons displayed on the screen.

15 If the purchasing person presses the new registration button 321, or selects one of the rules displayed in the rule list 313 and thereafter presses the correction button 322, a rule editor shown in FIG. 5 is displayed and rule generation/ correction is conducted.

20 The rule editor 41 may be displayed by switching from the auction condition input editor 31, or ~~they may be displayed~~ on the same screen by using the multi-window technique.

In the rule editor 41, a field 411 is used to  
25 select a price input method. Either the case where a price is specified or the case where the purchase at the lowest price is desired is specified. A field 412 located in the vicinity thereof is a field for inputting

a price in the case where a price is specified. A field 413 is used to input a maximum allowance in competition. A field 421 is used to select an amount input method serving as a condition of the purchase amount. Three  
5 specification methods are prepared: all amount purchase, fixed amount purchase, and range designation purchase. The all amount purchase specifies the purchase of the all purchasable amount in the auction. The fixed amount purchase specifies the purchase of a predetermined fixed  
10 amount. The range designation purchase specifies the purchase amount by using a range. Furthermore, in the vicinity of the field 421, a field 422 used to input the amount in the case of the fixed amount purchase and fields 423 and 424 used to input the range in the case of  
15 the range designation purchase are provided. A field 425 is used to specify whether a purchase is effected even if the available amount is less than the desired amount. Furthermore, on the screen, two icons, i.e., a button 431 for registration into the rule list, and a button 432 for  
20 suspending the rule generation/ correction on the way, are displayed.

In the case where a rule is to be generated/ corrected, it can be conducted by inputting the price condition to the fields 411 through 413, inputting the  
25 amount condition to the fields 421 through 425, and pressing a registration button 431. In the case where a rule is to be suspended on the way, the suspension button 432 is pressed.

In the case where the specified range purchase is specified in the amount condition and the upper amount is not prescribed, i.e., in the case where the upper limit should be set equal to the remaining quantity, only  
5 the lower limit is inputted to the field 423. In the case where the lower limit is not to be prescribed, only the upper limit is inputted to the field 424.

A generated rule can be deleted by using the deletion button 323. The generated rules are evaluated  
10 in the order shown in the rule list 313. For changing their priorities, therefore, priority change buttons 318 and 319 are used.

By pressing the transmission button 326, auction ordering information is transmitted to the  
15 electronic marketplace server 11 and participation in the auction is registered. The auction ordering information thus transmitted contains at least the rule list 313 and a flag added thereto to specify whether the purchasing person participates in the auction once a successful bid  
20 has been conducted. The transmission of the auction ordering information at this time can be implemented by using the function of the known browser, for example, such as the Netscape Navigator 3.0 produced by the  
Netscape <sup>Inc.</sup> company in U.S. In the case where a registra-  
25 tion number, registration time, and the like are transmitted from the electronic marketplace server 11 after completion of the registration, they may be displayed on the output device 123 or they may be stored

in the storage device 124. The registration number transmitted from the electronic marketplace server 11 may be used as an inquiry key for the electronic marketplace server 11 in the future. In the case where the participation in the auction is to be passed up, the suspension button 327 is pressed and the auction ordering information creation is terminated.

By a registration situation screen 51 shown in FIG. 6, the purchasing person client 12 procures the auction registration situation from the electronic marketplace server 11. On the registration situation screen 51, an ordering product list 511 is displayed. The ordering product list 511 is a list of the products ordered by the purchasing person. On the screen, icons of an auction ordering information display/ correction button 512, an order suspension button 513, an auction result display button 514, and a button 515 for closing the registration situation screen 51 are also displayed. In the ordering product list 511, a list of ordering products is displayed. In the ordering product list 511, the date and hour of registration of auction ordering information, the subject product number of the auction ordering information, and a flag representing the auction completion state are <sup>shown to be</sup> displayed. However, <sup>other</sup> detailed information ~~other than them~~ may be displayed. As for such an ordering situation, auction ordering information given from another purchasing person may be displayed.

In the case where the auction ordering

information is to be displayed/ corrected, a subject ordering product is selected out of the ordering product list 511 and the display/ correction button 512 is pressed. Thereupon, auction ordering information is  
5 displayed in the auction condition input editor 31. In the case where the auction ordering information is to be corrected, new auction ordering information is generated on the basis of the above described method and registered in the electronic marketplace server 11. In the case  
10 where ordering is to be suspended, a subject ordering product is selected out of the ordering product list 511 and the suspension button 513 is pressed.

In the case where the auction result is to be displayed, a subject ordering product is selected out of  
15 the ordering product list 511 and the result display button 514 is pressed. Thereupon, an auction result screen 61 shown in FIG. 7 appears. The auction result screen 61 includes a successful bid result 611, a transaction process 612, a rule result 613 contained in  
20 the auction ordering information, and a button 614 for closing the screen.

In the successful bid result 611, a successful bid result concerning the purchasing person and the entire successful bid result are included. The entire  
25 successful bid result includes hammer prices and the quantities of the successful bids in the order of success bid.

In the transaction process 612, the price,

amount and situation are included. The situation indicates the situation at that time. As the situation, "there are no desiring persons", "successful bidder determined", "competition occurrence and price rise",  
5 "competition continuation and price rise", or "competition vanished and successful bidder determined", for example, is displayed. The message "there are no desiring persons" indicates that there are no purchasing persons. The message "successful bidder determined"  
10 indicates that there are purchasing persons and a successful bidder has been determined. The message "competition occurrence and price rise" indicates the occurrence of a competition and a price rise caused to  
15 <sup>eliminate</sup> ~~vanish~~ the competition. The message "competition continuation and price rise" indicates that the competition is not <sup>eliminated</sup> ~~vanished~~ and the price has risen for competition <sup>elimination</sup> ~~vanishment~~. And the message "competition vanished and successful bidder determined" indicates the competition <sup>elimination</sup> ~~vanishment~~, the determination of a successful  
20 bidder, and a price rise for competition <sup>elimination</sup> ~~vanishment~~. In the case where a successful bid has been conducted, the successful bid amount is included.

In the rule results 613, the behavior of rules contained in the auction ordering information at the time  
25 of the auction are included. In the case where a successful bid has been conducted, the behavior at the time of the auction includes the hammer price and the successful bid amount. In the case where a successful

bid has not been conducted due to a competition, the behavior at the time of the auction includes failed prices. In the case where a rule has not been used, the fact is included in the behavior.

5                   Monitoring of the auction ordering information in the electronic marketplace server 11 will now be described. In FIG. 8, an electronic marketplace monitor 71 is shown. In the electronic marketplace monitor 71, a monitored product number 711, a registered purchasing  
10 person list 712, number of registrations 713, a message column 714, a product change button 715, and an end button 716 are included.

                  In the case where the monitored product is to be changed, the product change button 715 is pressed and  
15 the change is conducted by using a product selection screen 81 shown in FIG. 9. On the product selection screen 81, a registered product number list 811, an OK button 812, and a cancel button 813 are displayed. As for the change of the monitored product, a product to be  
20 monitored is selected out of the product number list 811 and the OK button 812 is pressed. In the case where the change is to be suspended, the cancel button 813 is pressed.

                  For each of purchasing persons who registered  
25 the auction ordering information, the registered purchasing person list 712 includes a registration number 7121, a purchasing person ID 7122, transmission time 7123 of auction ordering information from the purchasing

person client 12, and reception time 7124 of the auction ordering information in the electronic marketplace server 11. In the number of registrations 713, the current number of registrations of the auction ordering information is displayed. In the case where something should happen during monitoring, a predetermined message depending thereupon is displayed in a message 714.

In the case where auction ordering information of a product to be monitored has been received during monitoring of the auction ordering information, information 719 concerning the purchasing person who transmitted the newly received auction ordering information is displayed in the registered purchasing person list 712 as shown in FIG. 10. At the same time, a message indicating that the auction ordering information has newly arrived is displayed in the message column 714. At this time, an operation for calling the attention of an operator, such as a flashing display of information concerning the newly registered purchasing person, or a sound indication, may be conducted simultaneously.

Execution of an auction and monitoring of the execution will now be described. FIG. 11 shows an auction monitor 91, which is displayed on the output device 113 of the electronic market server 11 while an auction is being conducted. The auction monitor 91 includes a product number under auction 911, a list of purchasing persons who desire purchase 912, a number of purchasing persons who desire purchase 913, a remaining

B  
number of products 914, a current price 915, a field for visually displaying the current price <sup>916</sup>~~915~~, and a transaction process 917. As the field 916, a circular shaped gauge is used in FIG. 11.

B  
B  
5                    For each <sup>purchasing person</sup> ~~of purchasing persons who desire~~  
                  <sup>on</sup> ~~purchase~~, the list of purchasing persons who desire  
                  1 purchase 912 includes a registration number 9121, a purchasing person state 9122, a purchasing person ID 9123, a desired amount 9124, and an allocated amount  
10 9125. In the purchasing person state 9122, a state such as "desire" representing a desire for purchase, "abandon" representing abandonment of the purchase, or "successful bid" representing that a successful bid has been determined is displayed.

15                    The price 915 and the field 916 are moved in response to a price change so as to be interlocked with each other. The gauge of the field 916 is rotated in the counterclockwise direction whenever the price rises and rotated in the clockwise direction whenever the price  
20 falls. A price may be plotted on each indication point of the field 916 for more legibility. By doing so, the person watching the auction monitor 91 can judge visually with more ease whether the price has risen or fallen.

B  
25                    The transaction process 917 includes the contents contained in the transaction process 612 shown on the auction result screen 61 in the purchasing person client 12. Here, the purchasing person ID who has conducted a successful bid is also included.

Furthermore, a message for an operator monitoring the auction may also be included.

Examples of the auction monitor 91 in the middle of the auction are shown in FIGS. 11, 12 and 13.

5 In FIG. 11, registration numbers 1, 3 and 4, i.e., purchasing persons teramura, kosaka, and m-mori, desire the purchase when the price has reached ¥90. The desired amounts are 150, 60 and 80, respectively. In the transaction process 917, the fact that a competition has  
10 occurred at ¥90 is displayed.

From the state of FIG. 11, the price rises and the price has reached ¥93 as shown in FIG. 12. The current price 915 becomes 93, and the field 916 also rises according to it. At the time point of ¥93, the  
15 purchasing persons teramura and m-mori having the register numbers 1 and 4 give up the purchase. As a result, the competition <sup>s</sup>is vanished. In the transaction process 917, the fact that the competition has ~~been~~ vanished at ¥93 is displayed. When the price is rising,  
20 the background color of the field 916 may be changed or a sound may be produced in order to emphasize the fact that the price is rising.

The competition <sup>has</sup> ~~is~~ vanished as shown in FIG. 12, and a successful bidder has been determined as shown  
25 in FIG. 13. The purchasing person kosaka of the registration number 3 is a successful bidder. In the transaction process 917, the fact that kosaka has conducted a successful bid for 60 boxes at ¥93 is

displayed. The remaining quantity 914 has changed from 200 to 140.

The display of the auction ordering situation (FIG. 6), monitoring of the ordering situation (FIGS. 8, 9 and 10), and the display of the auction monitor (FIGS. 11, 12 and 13) are executed at any time according to a request from the terminal of the electronic marketplace server 11.

The auction method of the present invention will now be described in further detail. FIG. 1 is a processing flow of the entire automatic auction executed by the electronic marketplace server 11. Here, an auction is conducted on the basis of "method of descending price." In the "method of descending price," the auction is conducted while the price is being lowered.

First of all, an initial price is set (step 1101). This may be set equal to a calculable value such as a fixed value times the average successful bid price of the previous day, a fixed value times the average successful bid price of the past, or a fixed value times the average successful bid price of the same variety of another marketplace. <sup>In any case, a method should be chosen that eliminates any</sup> ~~Such a method that a suspicion of~~ price manipulation conducted by an auctioneer ~~is avoided~~ <sup>so that</sup> and fairness can be maintained ~~is desirable~~.

In the case where this price has become lower than the lowest price predetermined by the shipping person client 13, the auction is finished. In the case where the price is not lower than the lowest price, the

processing proceeds to step 1104 (step 1103). At step 1104, a purchasing person desiring the purchase is searched by using a purchase desiring purchasing person search routine. If there is a purchase desiring

5 purchasing person, processing proceeds to step 1106. If there is not a purchase desiring purchasing person, then the price is lowered by a predetermined fixed value (step 1102), and thereafter processing proceeds to step 1103 (step 1105).

10 At step 1106, it is determined whether there is a competitive state by using a competitive state judging routine. In the case where there is not a competitive state, processing proceeds to step 1109 (step 1107). In the case of a competitive state, the competitive state ~~is~~  
15 vanished<sup>s</sup> by using a competition vanishing routine (step 1108). Subsequently, products are allocated among purchasing persons desiring the purchase by using a product allocation routine (step 1109). If there are remaining products, the processing proceeds to the step  
20 1103. If there are no products, the auction is finished (step 1110).

The processing procedure of the purchase desiring purchasing person search routine (step 1104 of FIG. 1) will now be described by referring to FIG. 14.

25 In the case of the competitive state, operations as far as step 1206 are repeated for all purchasing persons desiring the purchase. In the case of <sup>a</sup>noncompetitive state, operations as far as the step 1206 are repeated

for all registered purchasing persons except purchasing persons who did not participate in the auction after conducting a successful bid once and who conducted a successful bid once (step 1201).

5           For all rules held by a subject purchasing person excepting rules fired once, operations as far as step 1204 are repeated (step 1202). Here, "firing" means participating in the auction, and means the case where the set price of the auction coincides with the desired  
10 auction price or the case where the set price of the auction is contained in the highest possible price for the desired auction price.

          If the current price is greater than the sum of the specified price of the subject rule and the highest  
15 possible price in competition in the competitive state and if the current price is greater than the specified price of the subject rule in the noncompetitive state, the processing proceeds to ~~the~~ step 1204. Otherwise, the processing proceeds to step 1207 (step 1203).

20           If the current price is greater than the specified price of the subject rule, then the step 1203 is repeated until all rules held by the purchasing person excepting fired rules are finished (step 1204). If the repetitive processing is finished, the subject purchasing  
25 person is excluded from purchase desiring purchasing persons (step 1205). Until the loop condition of the step 1201 is finished, the processing is repeated (step 1206).

If the current price is less than the specified price of the subject rule at the step 1203, a minimum desired amount and a maximum desired amount are set on the basis of the subject rule. In other words, if the amount specification of the subject rule is all amount purchase, the minimum desired amount is set equal to 0 and the maximum desired amount is set equal to the remaining quantity. If the amount specification of the subject rule is fixed amount purchase, the minimum desired amount is set equal to a specified amount and the maximum desired amount is set equal to a specified amount. If the amount specification of the subject rule is range designation purchase and its upper limit value is not prescribed, then the minimum desired amount is set equal to its lower limit value and the maximum desired amount is set equal to the remaining quantity. If the amount specification of the subject rule is range designation purchase and its lower limit value is not prescribed, then the minimum desired amount is set equal to 0 and the maximum desired amount is set equal to its upper limit value. If the amount specification of the subject rule is range designation purchase and both its upper limit value and its lower limit value are not prescribed, then the minimum desired amount is set equal to the lower limit value and the maximum desired amount is set equal to the upper limit value (step 1207).

It is determined whether the remaining quantity is less than the minimum desired amount set at the step

1207. If the remaining quantity is less than the minimum desired amount, then the processing proceeds to the step 1204. If the remaining quantity is greater than the minimum desired amount, then the processing proceeds to step 1209 (step 1208). The subject purchasing person is set to a purchase desiring purchasing person, and the firing rule is set to a subject rule (step 1209).

The detailed processing procedure of the competitive state judging routine (step 1106 of FIG. 1) will now be described by referring to FIG. 15. First of all, the sum total (sum total 1) of the minimum desired amounts of the purchasing persons desiring the purchase is calculated (step 1301). The minimum desired amount is a value set at the step 1207 of FIG. 14. If the remaining quantity is less than the sum of the sum total 1 derived at the step 1301 and the number of purchase desiring purchasing persons each having a minimum desired amount equal to zero, then the processing proceeds to step 1303. Otherwise, the state is judged to be an allocatable state and the judging routine is finished (step 1302).

Among the purchase desiring purchasing persons each having a nonzero desired amount, some persons do not purchase according to the amount condition of the firing rule if the amount is less than the minimum desired amount. The sum total (sum total 1) of the minimum desired amounts of such purchase desiring purchasing persons is calculated (step 1303).

If the remaining quantity is less than the sum of the sum total 2 derived at the step 1303, the number of purchase desiring purchasing persons each having a minimum desired amount equal to zero, and the number of  
5 purchase desiring purchasing persons who are included in the purchase desiring purchasing persons each having a nonzero minimum desired amount and who purchase even if the amount is less than the minimum desired amount according to the amount condition of the firing rule,  
10 then the state is judged to be a competitive state and the judging routine is finished. Otherwise, the processing proceeds to step 1305 (step 1304).

For the purchase desiring purchasing persons who are included in the purchase desiring purchasing  
15 persons each having a nonzero minimum desired amount and who purchase even if the amount is less than the minimum desired amount according to the amount condition of the firing rule, the minimum desired amount is set equal to 0. The state is judged to be an allocatable state, and  
20 the judging routine is finished (step 1305).

The detailed processing procedure of the competition vanishing routine (step 1108 of FIG. 1) will now be described by referring to FIG. 16. In the conventional auction method, the auction is conducted by  
25 gradually lowering the price. Once a competitive state is brought about, however, the auction is conducted by gradually raising the price and consequently narrowing down the purchasing persons in the present invention.

If a competition has occurred, the price is raised by a predetermined value (step 1401). If a resultant price has exceeded a predetermined fixed reference value, the processing proceeds to step 1407.

- 5 If the resultant price has not exceeded, <sup>the reference value</sup> the processing proceeds to step 1403 (step 1402).

By using the purchase desiring purchasing person search routine 1104 shown in FIG. 14, a purchase desiring purchasing person is searched for (step 1403).

- 10 If there is a purchase desiring purchasing person, the processing proceeds to step 1405. If there is not a purchase desiring purchasing person, the processing proceeds to step 1407 (step 1404). Subsequently, by using the competitive state judging routine 1106 of FIG.
- 15 15, it is determined whether the current state is a competitive state (step 1405).

In the case of the competitive state, the processing proceeds to step 1401. If the current state is not <sup>a</sup> the competitive state, the processing is finished

20 (step 1406). In the case where the processing has proceeded to the step 1407, the immediately preceding price state is restored. In this state, returning the state concerning the purchase desiring purchasing person to the original state is also included.

- 25 The processing flow of the product allocation routine (step 1109 of FIG. 1) will now be described by referring to FIGS. 17 and 18. In the ensuing processing, the minimum desired amount and the maximum desired amount

are ~~ones~~ set at the step 1207 of the purchase desiring purchasing person search routine shown in FIG. 14.

For all of the purchase desiring purchasing persons, the processing as far as step 1507 is repeated  
5 in the order of decreasing minimum desired amount, and in the order of time of registration of the auction ordering information to the electronic marketplace server 11 in the case where the minimum desired amounts are the same (step 1501). If the minimum desired amount of the  
10 subject purchasing person is not 0, then the processing proceeds to step 1503. If the minimum desired amount of the subject purchasing person is 0, then the processing proceeds to step 1506 (step 1502). If the remaining quantity is at least the minimum desired amount of the  
15 subject purchasing person, then the processing proceeds to step 1504. If the remaining quantity is less than the minimum desired amount of the subject purchasing person, then the processing proceeds to step 1508 (step 1503).

The minimum desired amount is allotted to the  
20 subject purchasing person, and the remaining quantity is decreased by the minimum desired amount (step 1504). If the amount specification of the firing rule of the subject purchasing person is not the fixed amount purchase, then the processing proceeds to the step 1506.  
25 In the case of the fixed amount purchase, the processing proceeds to the step 1507 (step 1505). The subject purchasing person is set to a variable amount purchasing person (step 1506).

Until the above described condition of the loop  
1 is finished, the processing beginning from the step  
1501 is repeated (step 1507). At step 1508, the proces-  
sing proceeds to step 1509, in the case where the subject  
5 purchasing person purchases according to the firing rule  
of the subject purchasing person even if the amount is  
less than the desired amount. In the case where the  
subject purchasing person does not purchase, the  
processing proceeds to step 1507. All of the remaining  
10 quantity is allotted to the subject purchasing person  
(step 1509), and the processing is finished.

If at the step 1507 there is a remaining  
product and there is a variable amount purchasing person,  
then the processing proceeds to step 1511. If there is  
15 not a remaining product or there is not a variable amount  
purchasing person, then the processing is finished (step  
1510).

As a loop 2, processing as far as step 1516 is  
repeated for all of the variable amount purchasing  
20 persons (step 1511). The amount allotted to the subject  
purchasing person is increased by one (step 1512). If  
the amount allotted to the subject purchasing person is  
equal to the maximum desired amount, the processing  
proceeds to step 1514. If the amount allotted to the  
25 subject purchasing person is not equal to the maximum  
desired amount, the processing proceeds to step 1515  
(step 1513).

At step 1514, the subject purchasing person is

not set to a variable amount purchasing person. If there is a remaining product, the processing proceeds to step 1516. Otherwise, the processing is finished (step 1515). At step 1516, the processing is repeated until the  
5 processing is finished for all of the variable amount purchasing persons.

Heretofore, detailed embodiments have been described. The concrete automatic auction method will now be described by referring to FIGS. 19 and 20.

10 FIG. 19 shows a condition 2010 in the automatic auction. FIG. 20 shows "registered purchasing persons and their auction ordering information" 2020. In the auction condition 2010, the quantity, initial price, increment of descending price, lowest price, increment of  
15 ascending price in competition, and highest ascending price are included. For each of the registered purchasing persons, the "registered purchasing persons and their auction ordering information" 2020 includes an auction rule and a flag indicating whether the registered  
20 purchasing person participates in the auction after the person has conducted a successful bid once.

On the basis of the conditions included in the auction condition 2010, the electronic marketplace server  
11 conducts an auction by using the "registered purchas-  
25 ing persons and their auction ordering information" 2020. Hereafter, contents of the operation will be described by referring to processing for each price.

(1) ¥100 to ¥96

From ¥100, the price is lowered by the predetermined increment of descending price (¥1). Even when the price has been lowered to ¥96, there are no purchasing persons desiring the purchase. Therefore, the  
5 price is further lowered.

(2) ¥95

A rule 2021 of a purchasing person A is fired. In other words, the purchasing person A appears as the purchase desiring purchasing person who coincides with  
10 the price condition (¥95). While the remaining quantity is 200 boxes, the desired quantity of the purchasing person A is 60 boxes. At this time, therefore, a competition does not occur. Accordingly, the desired amount of 60 boxes is allotted to the purchasing person  
15 A, and the remaining quantity is set to 140 boxes. As for the auction reopening price, the successful bid price ¥95, a price ¥94 next to the successful bid price, or a price raised by a constant ratio may be used. It is now assumed that the auction is reopened with the successful  
20 bid price.

(3) ¥95 to ¥91

The price is lowered by the predetermined increment of descending price (¥1). Even when the price has been lowered to ¥91, there are no purchasing persons  
25 desiring the purchase. Therefore, the price is further lowered. The rule 2021 of the purchasing person A does not become the subject of the evaluation, because its transaction has already been settled.

(4) ¥90

A rule 2022 of a purchasing person B and a rule 2023 of a purchasing person C are fired. As the purchase desiring purchasing person, the purchasing person B and  
5 the purchasing person C appear. While the remaining quantity is 140 boxes, the desired quantities are 100 boxes and 80 boxes, respectively. Since the total desired quantity is thus 180 boxes, a competition occurs. By raising the price by the predetermined increment of  
10 ascending price in competition (¥1), therefore, the competition is <sup>eliminated</sup> ~~vanished~~.

(5) ¥91 and ¥92

The highest possible price in competition is ¥2 in the rule 2022 of the purchasing person B. The highest  
15 possible price in competition is ¥4 in the rule 2023 of the purchasing person C. Even if the price is raised to ¥91, and then ¥92, therefore, both the purchasing person B and the purchasing person C desire the purchase. As a result, the competition <sup>does not vanish</sup> ~~is not vanished~~, and the price is  
20 further raised.

(6) ¥93

The raised price exceeds the highest possible price in competition (+¥2) in the rule 2022 of the purchasing person B. Therefore, the purchasing person B  
25 gives up the purchase, and the competition is vanished. As for the purchasing person C, the raised price is within the highest price in competition (+¥4) in the rule 2023 of the purchasing person C. At the price within the

range of purchase desire, therefore, the transaction is settled. As a result, the desired quantity of 80 boxes is allotted to the purchasing person C, and the remaining quantity becomes 60 boxes.

5 (7) ¥93 to ¥89

Due to the competitive state, the price was raised once. Since the competition has been vanished,<sup>an</sup> auction is conducted again with the remaining quantity.

At the reopening price ¥93, there are no purchasing persons desiring the purchase. Therefore, the price is lowered by the predetermined increment of descending price (¥1). When the price is lowered to ¥90, it coincides with the price specified by the purchasing person B. Since the remaining quantity is 60 boxes, however, it does not coincide with the purchase condition of the purchasing person B. Therefore, the transaction with the purchasing person B is not settled. Accordingly, the price is further lowered.

(8) ¥88

20 Since there are no purchasing persons desiring the purchase at ¥89, the price is further lowered. Thereupon, a rule 2024 of a purchasing person D is fired, and the purchasing person D appears as the purchasing person desiring the purchase. While the remaining  
25 quantity is 60 boxes at this time, the minimum desired amount is 50 boxes. Therefore, a competition is not caused. The minimum desired amount of 50 boxes is first allotted to the purchasing person D, and the purchasing

person D is set as the variable amount purchasing person. Since the remaining quantity is 10 boxes, the remaining quantity of 10 boxes is allotted to the purchasing person D which is the variable amount purchasing person. As a  
5 result, the purchasing person D purchases 60 boxes. Accordingly, the remaining quantity becomes 0 box<sup>es</sup>, and the auction is finished.

B  
In the present embodiment, the purchasing person client 12 registers rules concerning the auction  
10 into the electronic marketplace server 11 as the auction ordering information. The electronic marketplace server 11 conducts the auction on the basis of the auction ordering information. Therefore, it becomes unnecessary for the purchasing person client 12, i.e., the bidder, to  
15 stay before the auction terminal at the time of the auction.

By making the rule include the purchase conditions, it becomes possible to automatically and flexibly cope with the situation change at the time of  
20 the auction. Thus the on-line and real time properties are not necessarily required. As a result, auction transactions become possible on an open network on which it is difficult to assure the on-line and real time properties.

25 A countermeasure to the security will now be described. For implementing a safe auction, it becomes necessary to prevent a malicious third party from participating in the transaction and keep data concerning

B  
B  
B

When a purchasing person client 12 is registered as a purchasing person of the electronic marketplace server 11, the purchasing person ID and the password of the purchasing person are sent via telephone, FAX, mail or the communication network 14.

 $\wedge$

B  
5 encryption key, it is sent to a purchasing person client 12 via a storage medium such as an IC card or a floppy disk, or <sup>via</sup> the communication network 14, when the purchasing person client 12 has been registered as a purchasing person of the electronic marketplace server 11.

B  
Owing to the countermeasures heretofore described, it becomes possible to prevent a third party who does not know the purchasing person ID and the password <sup>from</sup> ~~form~~ participating in the transaction.

10 Furthermore, it becomes possible to prevent a person having no encryption key from conducting wiretapping for data concerning the auction and falsifying the data concerning the auction.

B  
As heretofore described in detail, the present invention solves the above described problems of the conventional technique and makes it unnecessary for bidders to stay before auction terminals at the time <sup>of</sup> auction. In addition, auction transactions become possible on an open network on which it is difficult to assure the on-line and real time properties. Thus the present invention brings about significant effects.
